## HOW TO READ THESE NUMBERS

Reference timestamps come from [Montreal Forced Aligner](#) using the `english_mfa` acoustic model. MFA itself has ~30–50 ms of alignment error on clean read speech and more on noisy or spontaneous audio — this is a *floor* on what these absolute numbers can mean. They are *fair across providers* because the same reference is applied to all of them, but should not be quoted externally as absolute provider accuracy without first validating the reference against human-annotated boundaries on a sample.

Substitutions where one ref word maps to multiple hypothesis words (e.g. ref "1992" → hyp "nineteen ninety two" under inverse text normalization) are merged into one comparable span so the timestamp comparison measures the full span

the model emitted. Without this, end-time error is systematically understated.

Lower is better for MAE / median / p90. Higher is better for tolerance %. ★ marks the best value in each row.
